In both education and training, teachers are faced with many and varied problems relating to their teaching and their students' learning.

Educational technology, in its widest sense, provides teachers with methods and tools which, if properly used, can alleviate some of these problems. The computer

is one such tool, offering, within certain limitations, some possible solutions. Originally published in 1979, this book describes the use of the computer as a resource and as a manager in education and training. It discusses the use, potential and limitations of this technology in helping the teacher and trainer. Beginning with a consideration of the role of the computer as a mediator in the flow of information between the

---

student and his learning environment, the book goes on to look at Computer Assisted Learning from an educational viewpoint, the strength and weaknesses of a number of different media, and the problems of managing modular courses and course structures and handling information on students' performance and progress. A chapter on informatics and education addresses the problem of what both teachers and

students should know about computers, while the final chapter examines the practical problems of prompting and organising the appropriate use of this technology.

These conference proceedings explore the design of pedagogical intervention and learning cultures, the inclusion of socio-emotional support in

teaching and policy, transforming technology to support the social fabric of our institutions, and challenging established beliefs about learning. They clarify the complex challenges involved in employing social learning in education and higher education institutions to foster greater understanding and insights, while also avoiding the pitfalls that come with rolling out the concept of “redesigning learning”. Assessment is a key driver in mathematics education.

This book examines computer aided assessment (CAA) of mathematics in

which computer algebra systems (CAS) are used to establish the mathematical properties of expressions provided by students in response to questions. In order to automate such assessment, the relevant criteria must be encoded and, in articulating precisely the desired criteria, the teacher needs to think very carefully about the goals of the task. Hence CAA acts as a vehicle to examine assessment and mathematics education in detail and from a fresh perspective. One example is

how it is natural for busy teachers to set only those questions that can be marked by hand in a straightforward way, even though the constraints of paper-based formats restrict what they do and why. There are other kinds of questions, such as those with non-unique correct answers, or where assessing the properties requires the marker themselves to undertake a significant computation. It is simply not sensible for a person to set these to large groups of students when marking by

---

hand. However, such questions have their place and value in provoking thought and learning. This book, aimed at teachers in both schools and universities, explores how, in certain cases, different question types can be automatically assessed. Case studies of existing systems have been included to illustrate this in a concrete and practical way.
