Targeting Maths for Victoria John Wiley & Sons

"Efforts to improve mathematics teaching and learning globally have led to the ever-increasing interest in searching for alternative and effective instructional approaches from others. Students from East Asia, such as China and Japan, have consistently outperformed their counterparts in the West. Yet, Bianshi Teaching (teaching with variation) practice, which has been commonly used in practice in China, has been hardly shared in the mathematics education community internationally. This book is devoted to theorizing the Chinese mathematical teaching practice, Bianshi teaching, that has demonstrated its effectiveness over half a century; examining its systematic use in classroom instruction, textbooks, and teacher professional

development in China; and showcasing of the adaptation of the variation pedagogy in selected education systems including Israel, Japan, Sweden and the US. This book has made significant contributions to not only developing the theories on teaching and learning mathematics through variation, but also providing pathways to putting the variation theory into action in an international context. "This book paints a richly detailed and elaborated picture of both teaching mathematics and learning to teach mathematics with variation. Teaching with variation and variation as a theory of learning are brought together to be theorized and exemplified through analysis of teaching in a wide variety of classrooms and targeting both the content and processes of mathematical thinking. Highly recommended." – Kaye Stacey, Emeritus Professor of Mathematics Education, University of Melbourne, Australia "Many teachers in England are excited by the concept of teaching with variation and devising variation exercises to support their pupils' mastery of mathematics. However, fully understanding and becoming proficient in its use takes time. This book provides a valuable resource to deepen understanding through the experiences of other teachers shared within the book and the insightful reflections of those who have researched this important area. – Debbie Morgan, Director for Primary Mathematics, National Centre for Excellence in the Teaching of Mathematics, United Kingdom"

In this report on the disclosure of climate data from the Climatic Research Unit (CRU) at the University of East Anglia, the Science and Technology Committee calls for the climate science community to become more transparent by publishing raw data and detailed methodologies. On the accusations relating to Professor Phil Jones's refusal to share raw data and computer codes, the Committee finds there was no systematic attempt to mislead and considers that his actions were in line with common practice in the climate science community, but those practices need to change. The Committee welcomes the appointment of the independent Climate Change E-mails Review led by Sir Muir Russell to investigate fully the allegations against CRU. The Committee has not looked at the science produced by CRU and it will be for the Scientific Appraisal Panel, announced by the University on 22 March, to determine whether the work of CRU has been soundly built. On the mishandling of Freedom of Information (FoI) requests, the Committee considers that much of the responsibility should lie with the University, not CRU. The leaked emails appear to show a culture of non-disclosure at CRU and instances where information may have been deleted to avoid disclosure, particularly to climate change sceptics. The failure of the University to grasp fully the potential damage this could do and did was regrettable. The University needs to re-assess how it can support academics whose expertise in FoI requests is limited.

In this book, leading experts in the field examine the current state of assessment practice and scholarship, explore what the future holds for assessment, and offer guidance to help educators meet these new challenges. The contributors root assessment squarely in several related disciplines to provide an overview of assessment practice and scholarship that will prove useful to both the seasoned educator and those new to assessment practice. Ultimately, Building a Scholarship of Assessment will help convince skeptics who still believe outcomes assessment is a fad and will soon fade away that this is an interdisciplinary area with deep roots and an exciting future.

Research in mathematics teacher education as a distinctive field of inquiry has grown substantially over the past 10-15 years. Within this field there is emerging interest in how mathematics teacher educators (MTEs) themselves learn and develop. Until recently there were few published studies on this topic, and the processes by which mathematics teacher educators learn, and the forms of knowledge they require for effective practice, had not been systematically investigated. However, researchers in mathematics education are now beginning to investigate the development of MTE expertise and associated issues. This volume draws on the latest research and thinking in this area is therefore timely to stimulate future development and directions. It will survey the emerging field of inquiry in mathematics education, combining the work of established scholars with perspectives of newcomers to the field, with the aim of influencing development of the field, invite cross-cultural comparisons in becoming a mathematics teacher educator by highlighting issues in the development of MTEs in different countries, and examine the roles of both mathematics educators and mathematicians in preparing future teachers of mathematics. The primary audience will be university-

based mathematics teacher educators and MTE researchers, and postgraduate research students who are seeking academic careers as MTEs. Additional interest may come from teacher educators in disciplines other than mathematics, and education policy makers responsible for accreditation and quality control of initial teacher education programs.
